STRENGTHS

Method Development

Built context dependent genetic regulation models and tested their behavior through simulations, giving collaborators clearer evidence for research decisions.

Reproducible Computing

Documented R workflows, environments, diagnostics, and provenance records so research partners could rerun analyses with confidence.

Genomic Integration

Connected association signals with xQTL, colocalization, TWAS, and molecular evidence, helping teams interpret complex disease biology.

Scientific Communication

Turned statistical limitations into clear manuscript sections and presentations, making technical findings useful for interdisciplinary audiences.

Collaborative Research

In lab meetings, feedback shaped revised models and validation plans, keeping computational work tied to meaningful biological questions.

SKILLS

R Statistical genetics

Functional genomics

Human genetics

Genomic data analysis

Multiomic data integration

Association analysis Fine mapping

xQTL analysis Colocalization

TWAS Simulation studies

Reproducible computing

Documented software Linux

SUMMARY

Statistical genetics researcher completing a Ph.D. in Biostatistics in 2026, with four years of doctoral research developing and applying quantitative methods for human genetic, genomic, and multiomic data. Research includes **genetic association analysis**, fine mapping, xQTL analysis, colocalization, TWAS, and molecular trait integration for complex disease biology. Proficient in R, Linux, HPC workflows, simulation studies, **reproducible scientific computing**, documented research software, and rigorous analysis of large datasets. Manuscript preparation, scientific presentations, collaborative research, and transparent computational practices connect methodological work with interpretable biological questions. Research on context dependent regulation and aging related molecular phenotypes supports future studies of **Alzheimer's disease** and the aging brain, with a clear foundation for developing an **independent research direction**.

EDUCATION

Ph.D. in Biostatistics

University of Michigan 🎓 GPA: 4.0 📅 2026 📍 Ann Arbor, MI

***Coursework:** Statistical genetics, functional genomics, biostatistics, human genetic data analysis*

Bachelor's Degree in Statistics

University of Wisconsin Madison 🎓 GPA: 4.0 📅 2021 📍 Madison, WI

***Coursework:** Statistical inference, regression analysis, probability, computational statistics*

TECHNICAL SKILLS

- **Programming Languages:** R, Bash, Linux shell
- **Statistical Genetics:** Genetic association analysis, fine mapping, linkage disequilibrium
- **Functional Genomics:** xQTL analysis, eQTL analysis, TWAS
- **Molecular Data:** Transcriptomics, multiomic integration, molecular phenotypes
- **Statistical Methods:** Simulation studies, regression, multiple testing
- **Computing Systems:** Linux, HPC, scheduled computing
- **Research Software:** Documented software, reusable R functions, version control
- **Reproducibility:** Reproducible reports, provenance records, environment specifications
- **Genomic Analysis:** Quality control, genomic files, phenotype data
- **Scientific Communication:** Manuscript preparation, scientific presentations, research seminars

EXPERIENCE

Doctoral Researcher, Statistical Genetics

University Research Lab 📅 September 2024 - October 2026 📍 Ann Arbor, MI

Led doctoral research across **statistical genetics** and **functional genomics**, developing methods, computational workflows, and scientific outputs for human genetic and molecular phenotype studies.

- Developed **context dependent genetic regulation** models, then evaluated operating characteristics through simulations and applied analyses.
- Built **R** workflows for association analysis and **fine mapping** across large genomic datasets using Linux and HPC scheduling.
- Integrated eQTL evidence with disease signals through **colocalization** analyses, documenting assumptions and diagnostic outputs for collaborators.
- Implemented TWAS analyses linking predicted molecular traits with complex phenotypes and functional genomic evidence.
- Maintained version controlled research software, environment specifications, and reproducible reports for auditable computational results.
- Drafted manuscript methods and results, then presented statistical findings to interdisciplinary research audiences.

LANGUAGES

MY CAREER

- Doctoral Researcher, Statistical Genetics at University Research Lab (2.1 Years)
- Graduate Research Assistant, Multiomic Data Integration at Academic Research (11 Months)
- Graduate Researcher, Human Genomics Methods at University Project (11 Months)
- Biostatistics Research Trainee at Student Lab (11 Months)

Graduate Research Assistant, Multiomic Data Integration

Academic Research 📅 September 2023 - August 2024 📍 Ann Arbor, MI

Supported quantitative research integrating genotype, transcriptomic, and regulatory data while building reusable analysis components and simulation frameworks for complex trait studies.

- Designed genotype and **transcriptomic** integration analyses that prioritized candidate mechanisms underlying complex human traits.
- Conducted simulations varying effect size, **linkage disequilibrium**, sample size, and molecular architecture to characterize method behavior.
- Developed reusable **R functions** for harmonization, **quality control**, testing, and visualization with documented checks.
- Ran **Linux** and HPC analyses while organizing jobs, logs, outputs, and **provenance records** for genomic datasets.
- Evaluated fine mapped loci against xQTL and functional genomic evidence, guiding follow up analyses and manuscript figures.
- Presented research progress at lab meetings and forums, incorporating feedback into revised models and validation plans.

Graduate Researcher, Human Genomics Methods

University Project 📅 September 2022 - August 2023 📍 Ann Arbor, MI

Conducted supervised human **genomics** research, translating statistical methods into reproducible analyses of curated genotype and phenotype datasets for academic evaluation.

- Investigated genetic association methods using curated **human genotype** and phenotype datasets under faculty supervision.
- Implemented association testing and **multiple testing** procedures in R, comparing calibration and power across datasets.
- Constructed reproducible notebooks covering cleaning, exploration, model fitting, diagnostics, and interpretation for research deliverables.
- Used Linux command line tools and scheduled computing resources to process genomic files reproducibly.
- Reviewed literature on **linkage disequilibrium**, **causal variant prioritization**, and molecular QTLs to inform project design.
- Delivered written methods reports and oral presentations distinguishing findings, uncertainty, and methodological limitations.

Biostatistics Research Trainee

Student Lab 📅 September 2021 - August 2022 📍 Ann Arbor, MI

Completed supervised quantitative research exercises in **biostatistics** and human genetics, building practical foundations in statistical inference, genomic analysis, and reproducible computing.

- Completed supervised research exercises using human genetics examples involving probability, regression, inference, and genomic analysis.
- Programmed R simulations examining sampling variability, model assumptions, type I error, and statistical power.
- Cleaned and summarized teaching datasets containing genotype and phenotype variables with structured quality checks.
- Practiced reproducible computing through scripted workflows, organized directories, data dictionaries, and generated reports.
- Participated in journal discussions on genetic association and **functional genomics**, preparing concise technical critiques.
- Presented a supervised final analysis to graduate seminar participants, explaining evidence and methodological limitations clearly.

PROJECTS

Context Dependent Regulation Methods 📅 2026

Developed and evaluated statistical methods for nonlinear genetic regulation, using simulation studies and human molecular phenotype data to assess performance and interpretability.

Multiomic Evidence Integration 📅 2024

Integrated genotype, transcriptomic, regulatory, xQTL, and disease association evidence to prioritize mechanisms underlying complex human traits.

LEADERSHIP & AWARDS

- Graduate Research Fellowship, 2024
- Outstanding Graduate Research Presentation, 2025
- Dean's List, 2020
- Graduate Quantitative Methods Peer Mentor, 2024 to 2026

CERTIFICATIONS

- Reproducible Research Practices Certificate 📅 2023
- Linux for Scientific Computing 📅 2022

PROFESSIONAL AFFILIATIONS

- Genomics Journal Club Coordinator, 2023 to 2025
- Graduate Quantitative Methods Peer Mentor, 2024 to 2026
